

Security Window Intercom

Safe, clear and secure communication with your customers.

As a leading nationwide electronic security integrator, we specialise in Corporate and Government electronic security solutions. An essential service, available 24/7, we are your trusted security provider.

SECURING NEW ZEALAND'S MOST IMPORTANT ORGANISATIONS

A window security intercom system using high-security barrier glass is essential for sites with service windows, such as pharmacies, service stations, hospitals, banks, government departments, local councils, consulates, retail stores or doctors surgeries.

Advanced Security presents a security window intercom system using acoustic tube with a noise-cancelling microphone.

Producing clear sound with good volume, allowing smooth communication between the two sides of a service window barrier.

Service Side

- Gooseneck type microphone or monotype headset can be used.
- Uses a voice-actuated communication system, requiring no additional operations during the conversation.
- When the TALK switch is off, the Operation Unit is put in standby, but still, the sound from the public side can be heard at a reduced volume.
- Automatically switches to communication mode when a customer is present.
- If a paging speaker is connected, the paging function can be used for calling people in a waiting room.

Public Side

- An acoustic tube system ensures clear sound quality at an optimum volume.
- Noise-cancellation reduces unwanted background noise, enabling smooth conversation.
- The thin shape of the acoustic tube means the field of vision is not obstructed.
- Holes in the barrier glass are not necessary, allowing easier installation and improved safety.
- Does not affect air conditioners.
